1st order Ordinary Differential Equation:

$$\frac{dx(t)}{dt} = f(x(t), t, \theta)$$

x is a variable we are interested in,

t is (typically) time,

f is a function of x and t, it is the differential,

θ parameterizes f (optionally).

Ordinary Differential Equations (ODEs)

Initial value problem:

$$\frac{dx(t)}{dt} = f(x(t), t, \theta); \quad x(t_0) \text{ is given;} \quad x(t_1) = \ ?$$

Many physical processes follow this template!

Ordinary Differential Equations (ODEs)

Initial value problem:

$$\frac{dx(t)}{dt} = f(x(t), t, \theta); \quad x(t_0) \text{ is given;} \quad x(t_1) = \ ?$$

Solution:

$$x(t_1) = x(t_0) + \int_{t_0}^{t_1} f(x(t), t, \theta)\, dt$$

Ordinary Differential Equations (ODEs)

Initial value problem:

$$\frac{dx(t)}{dt} = f(x(t), t, \theta); \quad x(t_0) \text{ is given}; \quad x(t_1) = \ ?$$

Solution:

$$x(t_1) = x(t_0) + \int_{t_0}^{t_1} f(x(t), t, \theta)\, dt$$

Example:

$$\frac{dx}{dt} = 2t;\ x(0) = 2;\ x(1) = \ ?$$

$$\begin{aligned} \Rightarrow x(1) &= x(0) + \int_0^1 2t\, dt \\ &= x(0) + (t^2|_{t=1} - t^2|_{t=0}) \\ &= 2 + 1^2 - 0^2 \\ &= 3 \end{aligned}$$

Initial value problem:

$$\frac{dx(t)}{dt} = f(x(t), t, \theta); \quad x(t_0) \text{ is given;} \quad x(t_1) = \ ?$$

Solution:

$$x(t_1) = x(t_0) + \boxed{\int_{t_0}^{t_1} f(x(t), t, \theta)\, dt}$$

What if this cannot be analytically integrated?

Initial value problem:

$$\frac{dx(t)}{dt} = f(x(t), t, \theta); \quad x(t_0) \text{ is given}; \quad x(t_1) = \ ?$$

Solution:

$$x(t_1) = x(t_0) + \boxed{\int_{t_0}^{t_1} f(x(t), t, \theta)\, dt}$$

What if this cannot be analytically integrated?

Example:

$$\frac{dx}{dt} = 2xt \ ; \ x(0) = 3$$
$$\Rightarrow \int \frac{1}{2x}\, dx = \int t\, dt$$
$$\Rightarrow \frac{1}{2}\log x = \frac{1}{2}t^2 + c_0$$
$$\Rightarrow x(t) = ce^{t^2}$$
$$x(0) = 3 \Rightarrow c = 2$$
$$\therefore x(t) = 2e^{t^2}$$
$$\Rightarrow x(1) = 5.436$$

Initial value problem:

$$\frac{dx(t)}{dt} = f(x(t), t, \theta); \quad x(t_0) \text{ is given}; \quad x(t_1) = \ ?$$

Solution:

$$x(t_1) = x(t_0) + \int_{t_0}^{t_1} f(x(t), t, \theta)\, dt$$

Initial value problem:

$$\frac{dx(t)}{dt} = f(x(t), t, \theta); \;\; x(t_0) \text{ is given}; \;\; x(t_1) = \;?$$

Solution:

$$x(t_1) = x(t_0) + \int_{t_0}^{t_1} f(x(t), t, \theta)\, dt$$

Solution:

$$x(t_1) = x(t_0) + \int_{t_0}^{t_1} f(x(t), t, \theta)\, dt$$

$$(\text{Solution: } x(t) = 2e^{t^2};\; x(1) = 5.436)$$

$$\boxed{h = 0.25}$$

$$\begin{aligned}
x(0.25) &= x(0) + 0.25 * f(x(0), 0) \\
&= 3 + 0.25 * (2 * 3 * 0) \\
&= 3 \\
x(0.5) &= x(0.25) + 0.25 * f(x(0.25), 0.25) \\
&= 3 + 0.25 * (2 * 3 * 0.25) \\
&= 3.375 \\
x(0.75) &= x(0.5) + 0.25 * f(x(0.5), 0.5) \\
&= 3.375 + 0.25 * (2 * 3.375 * 0.5) \\
&= 4.21875 \\
x(1) &= x(0.75) + 0.25 * f(x(0.75), 0.75) \\
&= 4.21875 + 0.25 * (2 * 4.21875 * 0.75) \\
&= 5.8008
\end{aligned}$$

Paradigm shift: whereas earlier f was pre-defined/hand-designed according to the domain, here we would like to estimate an f that suits our objective.

Latent ODEs for Irregularly-Sampled Time Series

(Rubanova et al., NeurIPS 2019)

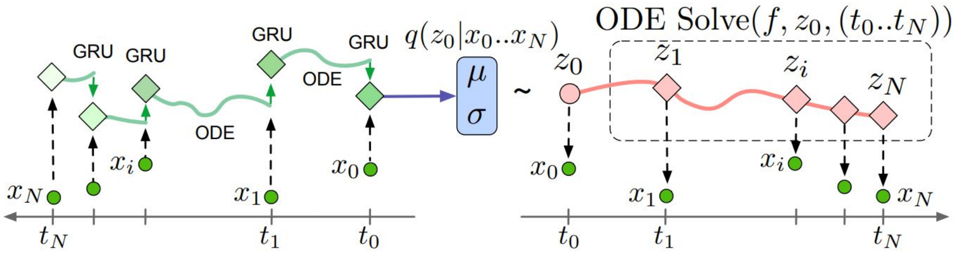

Figure 2: The Latent ODE model with an ODE-RNN encoder. To make predictions in this model, the ODE-RNN encoder is run backwards in time to produce an approximate posterior over the initial state: $q(z_0|\{x_i, t_i\}_{i=0}^N)$. Given a sample of z_0, we can find the latent state at any point of interest by solving an ODE initial-value problem. Figure adapted from Chen et al. [2018].

ODE2VAE: Deep generative second order ODEs with Bayesian neural networks (Yildiz et al., NeurIPS 2019)

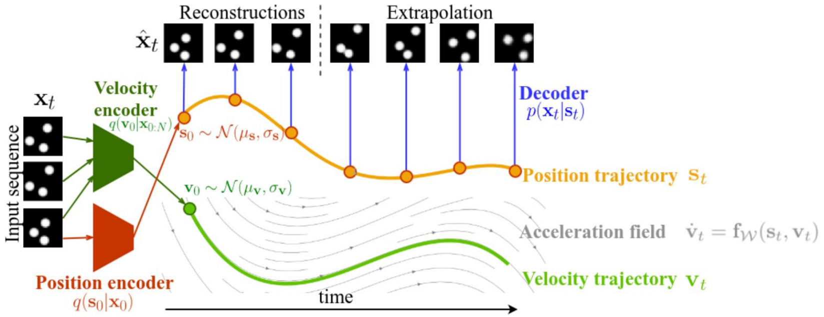

Figure 2: A schematic illustration of ODE^{2}VAE model. Position encoder $(\boldsymbol{\mu}_\mathbf{s}, \boldsymbol{\sigma}_\mathbf{s})$ maps the first item $\mathbf{x}_0$ of a high-dimensional data sequence into a distribution of the initial position $\mathbf{s}_0$ in a latent space. Velocity encoder $(\boldsymbol{\mu}_\mathbf{v}, \boldsymbol{\sigma}_\mathbf{v})$ maps the first m high-dimensional data items $\mathbf{x}_{0:m}$ into a distribution of the initial velocity $\mathbf{v}_0$ in a latent space. Probabilistic latent dynamics are implemented by a second order ODE model $\tilde{\mathbf{f}}_\mathcal{W}$ parameterised by a Bayesian deep neural network ($\mathcal{W}$). Data points in the original data domain are reconstructed by a decoder.
